Intake

Visitors describe one fault per item. The intake volunteer records the item type and visible damage.

Triage

Items with cracked power cables are isolated. Volunteers discuss other faults at the assessment desk.

Consent

Visitors approve the proposed repair before work begins. A volunteer records any limits on the requested work.

Parts

Spare parts are labeled by item type. An unavailable part is listed on a follow-up card.

Workstations

Each workbench serves one repair at a time. Small loose parts stay in a numbered tray.

Buddy checks

A second volunteer checks the repair notes before the item is returned. Unresolved issues are written on the return card.

Tool tracking

Shared tools have numbered tags. A volunteer checks the tool board at the end of each session.

Visitor learning

Visitors may observe the repair from the marked area. Volunteers explain the recorded fault after the work is complete.

Waste separation

Removed batteries go into a dedicated collection box. Other replaced parts are sorted by material.

Pilot measures

The pilot counts completed and unresolved repairs separately. Time spent waiting for parts is excluded from active repair time.
