Order windows

The pilot accepts orders before noon. Orders received later are assigned to the next working day.

Pickup labels

Each parcel receives a short pickup code. The public label excludes the recipient phone number.

Route planning

The morning route visits three campus zones. A closed path is replaced by the signed accessible route.

Pickup confirmation

The rider scans the parcel at pickup. An unreadable code is entered manually with a second check.

Handover

The recipient provides the pickup code at handover. The rider records completion without taking a face photo.

Missed delivery

A missed parcel returns to the service desk. The recipient receives a new pickup window.

Weather changes

Heavy rain pauses the pilot route. The desk updates recipients before the route restarts.

Capacity

A rider carries at most six parcels on one trip. Remaining parcels wait for the next scheduled trip.

Damaged packaging

Damaged outer packaging is recorded before pickup. The desk confirms whether the parcel should continue.

Evaluation

The team reports completed trips and missed deliveries separately. Waiting time at a closed path is recorded as a route delay.
